

Flow measurement with D30 sensors at working temperatures up to +350 °C optional with integrated transducer UFA capable of parameterization

Vane wheel flow sensor D30
(see Page 3 for measurements)

Measurable variable

- actual flow velocity v [m/s] in air/gases

Measuring range

- 0.3 ... 3.0 m/s

Functional principle

- vane wheel flow sensor
- scanning the vane rotation; non-contact inductive proximity switch

Advantages

- minimum reaction time
- high time yield thanks to ultralight titanium vane wheel which is easy on the bearings
- corrosion resistant
- can be sterilized
- high working temperature and pressure range
- operates largely irrespective of density and composition of gas
- low pressure drop
- easy adjustment to process parameter

Design

- insertion probe with AS80 housing

Medium

- air, gas mixtures and clean gases

Range and examples of application

- flow measurement of air, exhaust gas, process gas, for example
- monitoring laminar flow
- monitoring flow in pharmaceutical works

Humidity in the gas

- relative gas humidity of less than 100 % does not affect the measuring uncertainty
