

**Extendable vane wheel flow sensors,
 optional with \pm directional sensing and integrated PT100 sensor and accessories
 for connection to a fixed or portable evaluation unit**

Measurable variables

- flow velocity v [m/s] and
- flow rate [m³/h] in air/gases and water/liquids
- conversion to standard velocity/standard flow rate by measuring or entering working pressure and temperature parameters

Measuring range

- 0.2 ... 120 m/s gases
- 0.01 ... 10 m/s liquids

Medium

- air, gas mixtures and clean gases
- water/liquids

Funktionsprinzip

- vane wheel flow sensor
- sensing the vane rotation; non-contact by means of inductive proximity switch

Design

- insertion probe with fixed cable, extendable

Examples of application

- flow measurement e.g. of air, exhaust gas, process gas
- in processes with varying and/or unknown gas compositions
- flow monitoring in pharmaceutical installations
- monitoring neutralisation processes
- use up to 550 °C
- measurement of flammable liquids
- measuring in surface waters
- measuring in non-conducting liquids, for example such as ultra pure water in the semiconductor industry
- recommended according to DIN EN ISO 16911, normative for verification of automatic measuring equipment

Connection possibilities

- portable and fixed evaluation units with sensor input

Advantages

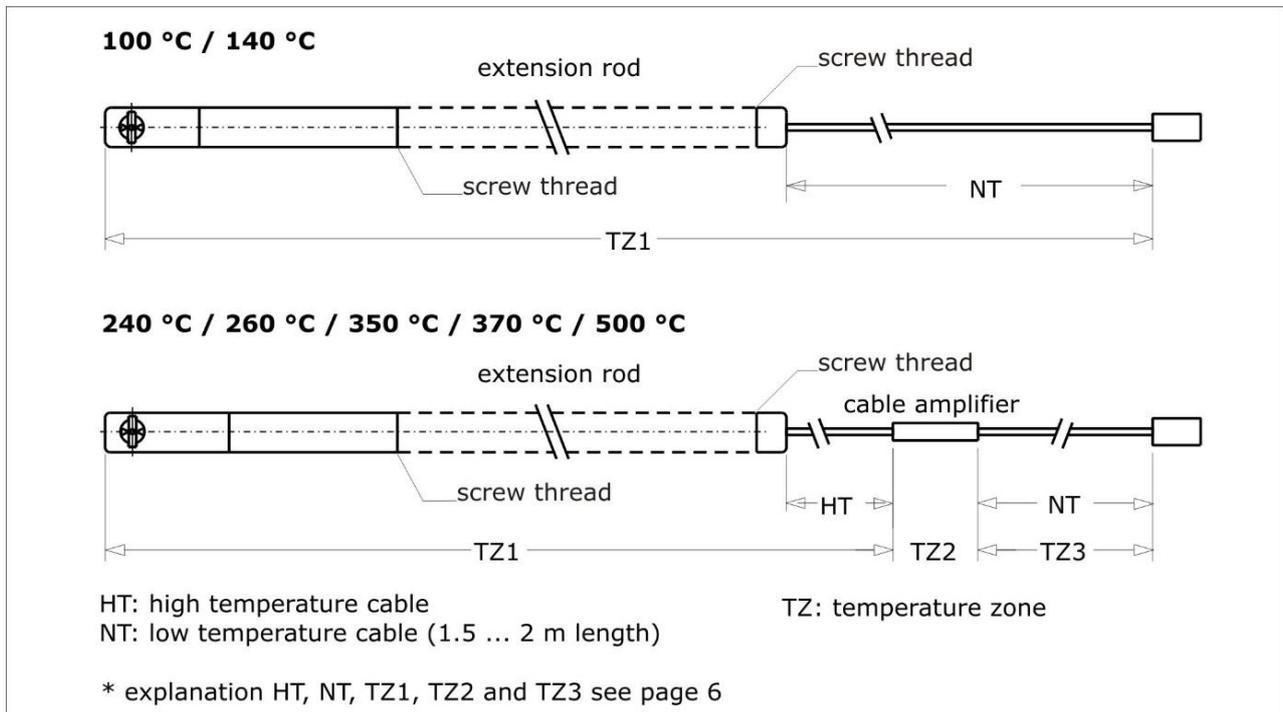

- accurate measured values even in varying and/or unknown gas compositions
- turndown ration approx. 1:100
- no distortion of values due to thermal radiation
- optional application in category 2 (zone 1)
- universal application spectrum
- extendable
- optional with \pm directional sensing
- optional with integrated PT100 sensor
- small pressure loss

Humidity in teh sample gas

- relative gas humidity of less than 100 % has no impact on the measurement uncertainty

Particles in the medium

- can cause restriction in the fatigue strength of the vane wheel set

Basic types

measurement in air and other gaseous media

Measurement uncertainty / repeatability with a gas density of approx. 1.2 kg/m³

Linearisation of characteristics	all types	up to < 0.9 % of measured value + 0.25 % of terminal value ***
Frequency response characteristics (interchangeability is guaranteed)	D, DR, DT	< 1.5 % of measured value + 0.5 % of terminal value (up to 40 m/s)
Repeatability		±(0.05 % of measured value + 0.02 m/s)

The lowest measurement uncertainties in the field are attained with calibrations as close as possible to the operating conditions. For this, the measurement results obtained can be implemented as characteristic in the evaluation unit. Information and details on the measurement uncertainties according to the calibrated measurement standards can be found in the calibration documents 'U325 and U183'.

*** on request, in the calibration range of the respective accredited test bench

Measurement uncertainty / repeatability in water *

Linearisation of characteristics	all types	< 1 % of measured value + 0.5 % of terminal value **
Frequency response characteristics (interchangeability is guaranteed)	D, DR	< 1.5 % of measured value + 0.5 % of terminal value
Repeatability		±(0.05 % of measured value + 0.02 m/s)

The lowest measurement uncertainties in the field are attained with calibrations as close as possible to the operating conditions. For this, the measurement results obtained can be implemented as characteristic in the evaluation unit. Information and details on the measurement uncertainties according to the calibrated measurement standards can be found in the calibration documents 'U325 and U183'.

* for water and liquids with a viscosity of up to approx. 0.0002 m²/s (200 cSt)

** on request, in the calibration range of the respective test bench

optional

ISO or DAkkS Calibration certificate v/FA*

calibration medium air, 6 calibration values in the measuring range

article no.: KLB

* An engraved dot on the sensor head indicates the upstream side during calibration. Details of additional calibration values or customised calibrations can be found in document 'U183 Calibration' or are available on request

Smallest measurable values, density influence

The smallest measurable value for measurements in air/gases specified in our documents results from a measuring medium density $\rho \cong 1.204 \text{ kg/m}^3$. The smallest measurable value v_0 is also increased/decreased negligibly even with a considerably different medium density from 1.204 kg/m^3 and follows in good approximation the relation:

$$v_{0,real} = v_{0,specif.} * \sqrt{1.204 \text{ kg/m}^3 / \rho_{real}}$$

The characteristic is displaced by the difference

$$v_{0,specif.} - v_{0,real} = \Delta v$$

Readout of measured values is too great by the amount Δv when measuring in gases of a density of ρ_{real} greater than 1.204 kg/m^3 , and too small by the amount Δv when measuring in gases of a density of ρ_{real} less than 1.204 kg/m^3 . Δv is to be added to or subtracted from the respective output value.
